Job Summary

The Epicor Development Engineer is responsible for the design, development, implementation and support of the business application software solutions for the Company's Epicor ERP system.

Main Functions & Duties

- To provide support to the organisation via the internal helpdesk system.
- To provide ongoing analysis of the data gathered within the system.
- To understand the current processes and to look for opportunities to extend the use of Epicor.
- The ability to document functional requirements based upon discussions with the department stake-holder.
- The ability to configure the system and its data based upon decisions made by the business either manually or by DMT.
- To improve the overall knowledge within the company on how the system works.
- To reduce the use of external systems and bring them back into Epicor.
- To ensure any new requests from departments do not have a detrimental impact on other departments.
- To provide solutions for minor gaps that are not intrusive to the base system via either BAQ's, Dashboard, BPM's or UD fields.

Working Conditions

The role is based at our offices in Hunmanby, North Yorkshire. It is a requirement of this role that the job holder will be prepared to travel nationally and internationally on company business.
